LECTURE

A BRIEF INTRODUCTION TO JAVASCRIPT

WHAT IS JAVASCRIPT?

- JavaScript is a lightweight, cross-platform, object-oriented computer programming language 😅
- JavaScript is one of the three core technologies of web development
- Today, JavaScript can be used in different places:
  - **Client-side: JavaScript was traditionally only used in the browser**
  - Server-side: Thanks to node.js, we can use JavaScript on the server as well
- Javascript is what made modern web development possible:
  - Dynamic effects and interactivity
  - Modern web applications that we can interact with
- **Frameworks/libraries like React and Angular are 100% based on JavaScript: you need to master JavaScript in order to use them!**

JS

THE ROLE OF JAVASCRIPT IN WEB DEVELOPMENT

CONTENT

PRESENTATION

DYNAMIC EFFECTS/
PROGRAMMING

NOUNS, ADJECTIVES AND VERBS

CONTENT

PRESENTATION

DYNAMIC EFFECTS/
PROGRAMMING

NOUNS

`<p></p>`

means “paragraph”

ADJECTIVES

`p {color: red;}`

means “the paragraph text is red”

VERBS

`p.hide();`

means “hide the paragraph”

JAVASCRIPT VERSIONS... (MORE ABOUT THIS LATER)

VARIABLES AND DATA TYPES

PRIMITIVE JAVASCRIPT DATA TYPES

1. **Number:** Floating point numbers, for decimals and integers
2. **String:** Sequence of characters, used for text
3. **Boolean:** Logical data type that can only be `true` or `false`
4. **Undefined:** Data type of a variable that does not have a value yet
5. **Null:** Also means 'non-existent'

JavaScript has dynamic typing: data types are **automatically** assigned to variables

BOOLEAN LOGIC

BASIC BOOLEAN LOGIC: NOT, AND & OR

var A

var B

AND	TRUE	FALSE
TRUE	TRUE	FALSE
FALSE	FALSE	FALSE

var A

var B

OR	TRUE	FALSE
TRUE	TRUE	TRUE
FALSE	TRUE	FALSE

- `AND (&&) =>` `true` if **ALL** are `true`
- `OR (||) =>` `true` if **ONE** is `true`
- `NOT (!) =>` inverts `true`/`false` value

```
var age = 16;

age >= 20;     // => false
age < 30;      // => true
!(age < 30);   // => false

age >= 20 && age < 30; // =>
age >= 20 || age < 30; // =>
```

JAVASCRIPT VERSIONS: ES5, ES6 / ES2015 AND ES6+

A (VERY) SHORT HISTORY OF JAVASCRIPT

- **1996:** Changed from LiveScript to JavaScript to attract Java developers. **JavaScript has almost nothing to do with Java** ☝️
- **1997:** ES1 (ECMAScript 1) became the first version of the JavaScript language standard:
  - ECMAScript: The language standard;
  - JavaScript: The language in practice.
- **2009:** ES5 (ECMAScript 5) was released with lots of new features.
- **2015:** ES6/ES2015 (ECMAScript 2015) was released: **the biggest update to the language ever!**
- **2015:** Changed to an **annual release cycle** 🙏
- **2016/2017/2018/2019/…:** Release of ES2016/ES2017/ES2018/ES2019/…

JAVASCRIPT TODAY: WHICH VERSION TO USE?

ES5

- Fully supported in all browsers;
- Ready to be used today 👍

ES6/ES2015

ES7/ES2016

ES8/ES2017

- Well supported in all **modern** browsers
- No support in older browsers;
- Can use **most** features in production with transpiling and polyfilling (converting to ES5) 😃

ES9/ES2018

ES10/ES2019

- Future versions, together called ESNext;
- Some features supported in modern browsers;
- Can already use **some** features in production with transpiling and polyfilling 😊

http://kangax.github.io/compat-table

(As of mid-2018)

WE USE ES5 AND ES6 IN THIS COURSE: WHY?

ES5

- JavaScript fundamentals
- How the language works
- DOM manipulation project
- Advanced language features
- Huge real project

ES6+

- ES6/ES2015 introduction
- Asynchronous JavaScript
- AJAX and API calls
- Modern dev setups (Webpack and Babel)
- Huge real project

- You will have to understand ES5 today and in the future;
- Many tutorials and code you find online today are still in ES5;
- When working on older codebases, these will be written in ES5;
- It's better and easier to learn the fundamentals in ES5, and then update to ES6+.

HOW OUR CODE IS EXECUTED: JAVASCRIPT PARSERS AND ENGINES

WHAT HAPPENS TO OUR CODE?

OUR CODE

```
function calculateAge(yearOfBirth) {
    return 2016 - yearOfBirth;
}

var johnsAge = calculateAge(1990);

function yearsUntilRetirement(name, yearOfBirth) {
    var age = calculateAge(yearOfBirth);
    var retirement = 65 - age;
    if (retirement >= 0) {
        console.log(name + ' retires in ' + retirement + ' years.');
    } else {
        console.log(name + ' is already retired.');
    }
}

yearsUntilRetirement('John', 1990);
```

JAVASCRIPT ENGINE

JONAS.IO
SCHMEDTMANN

THE COMPLETE JAVASCRIPT COURSE

BUILD REAL-WORLD PROJECTS!

@JONASSCHMEDTMAN

SECTION

HOW JAVASCRIPT WORKS BEHIND THE SCENES

LECTURE

EXECUTION CONTEXTS AND THE EXECUTION STACK

EXECUTION CONTEXTS

Execution Context

(A box, a container, or a wrapper which stores variables and in which a piece of our code is evaluated and executed)

```
function calculateAge(yearOfBirth) {
    return 2016 - yearOfBirth;
}

var johnsAge = calculateAge(1990);

function yearsUntilRetirement(name, yearOfBirth) {
    var age = calculateAge(yearOfBirth);
    var retirement = 65 - age;
    if (retirement >= 0) {
        console.log(name + ' retires in ' + retirement + ' years.');
    } else {
        console.log(name + ' is already retired.');
    }
}

yearsUntilRetirement('John', 1990);
```

THE DEFAULT

Global Execution Context

- Code that is **not inside any function**
- Associated with the **global object**
- In the browser, that's the `window` object

```
lastName === window.lastName
// true
```

```
var name = 'John';

function first() {
    var a = 'Hello!';
    second();
    var x = a + name;
}

function second() {
    var b = 'Hi!';
    third();
    var z = b + name;
}

function third() {
    var c = 'Hey!';
    var z = c + name;
}

first();
```

HOW JAVASCRIPT WORKS BEHIND THE SCENES

LECTURE

EXECUTION CONTEXTS IN DETAIL: CREATION AND EXECUTION PHASES AND HOISTING

THE EXECUTION CONTEXT IN DETAIL

EXECUTION CONTEXT OBJECT

- Variable Object (VO)
- Scope chain
- “This” variable

1. Creation phase

A) Creation of the Variable Object (VO)

B) Creation of the scope chain

C) Determine value of the ‘this’ variable

2. Execution phase

The code of the function that generated the current execution context is ran line by line

THE VARIABLE OBJECT

- The `argument` object is created, containing all the arguments that were passed into the function.
- Code is scanned for **function declarations**: for each function, a property is created in the Variable Object, **pointing to the function**.
- Code is scanned for **variable declarations**: for each variable, a property is created in the Variable Object, and set to `undefined`.

HOISTING

@JONASSCHMEDTMAN

SECTION

HOW JAVASCRIPT WORKS BEHIND THE SCENES

LECTURE

SCOPING AND THE SCOPE CHAIN

SCOPING IN JAVASCRIPT

- Scoping answers the question “where can we access a certain variable?”
- **Each new function creates a scope**: the space/environment, in which the variables it defines are accessible.
- **Lexical scoping**: a function that is lexically within another function gets access to the scope of the outer function.

```
var a = 'Hello!';
first();

function first() {
    var b = 'Hi!';
    second();

    function second() {
        var c = 'Hey!';
        console.log(a + b + c);
    }
}
```

(VO: Variable Object)

EXECUTION STACK VS SCOPE CHAIN

```
var a = 'Hello!';
first();

function first() {
    var b = 'Hi!';
    second();

    function second() {
        var c = 'Hey!';
        third()
    }
}

function third() {
    var d = 'John';
    console.log(a + b + c + d);
}
```

Order in which functions are **called**

≠

Order in which functions are **written lexically**

JONAS.IO

@JONASSCHMEDTMAN

SECTION

HOW JAVASCRIPT WORKS BEHIND THE SCENES

LECTURE

THE 'THIS' KEYWORD

THE ‘THIS’ VARIABLE

- **Regular function call**: the `this` keyword points at the global object, (the `window` object, in the browser).
- **Method call**: the `this` variable points to the object that is calling the method.

- *The `this` keyword is not assigned a value until a function where it is defined is actually called.*

THE DOM AND DOM MANIPULATION

THE DOCUMENT OBJECT MODEL

- **DOM:** Document Object Model;
- Structured representation of an HTML document;
- The DOM is used to connect webpages to scripts like JavaScript;
- For each HTML box, there is an object in the DOM that we can access and interact with.

```
<body>
  <section>
    <p>A paragraph with a <a>link</a>.</p>
    <p>Another second paragraph.</p>
  </section>
  <section>
    <img src="x.jpg" alt="The DOM">

LECTURE

EVENTS AND EVENT HANDLING: ROLLING THE DICE

WHAT ARE EVENTS?

- **Events:** Notifications that are sent to notify the code that something happened on the webpage;
- Examples: clicking a button, resizing a window, scrolling down or pressing a key;
- **Event listener:** A function that performs an action based on a certain event. It waits for a specific event to happen.

HOW EVENTS ARE PROCESSED

WHAT YOU WILL LEARN IN THIS LECTURE

- How to set up an event handler;
- What a callback function is;
- What an anonymous function is;
- Another way to select elements by ID;
- How to change the image in an `<img>` element.

EVERYTHING IS AN OBJECT: INHERITANCE AND THE PROTOTYPE CHAIN

OBJECTS IN JAVASCRIPT

Everything is an object.

(Well, almost everything)

PRIMITIVES

- Numbers
- Strings
- Booleans
- Undefined
- Null

EVERYTHING ELSE ...

- Arrays
- Functions
- Objects
- Dates
- Wrappers for Numbers, Strings, Booleans

... IS AN OBJECT

THE OBJECT ORIENTED PARADIGM

OBJECT-ORIENTED PROGRAMMING

- Objects interacting with one another through methods and properties;
- Used to store data, structure applications into modules and keeping code clean.

```
var john = {
    name: 'John',
    yearOfBirth: 1990,
    isMarried: false
};
```

```
var jane = {
    name: 'Jane',
    yearOfBirth: 1969,
    isMarried: true
};
```

```
var mark = {
    name: 'Mark',
    yearOfBirth: 1948,
    isMarried: true
};
```

CONSTRUCTORS AND INSTANCES IN JAVASCRIPT

INHERITANCE IN GENERAL

INHERITANCE IN JAVASCRIPT: PROTOTYPES AND PROTOTYPE CHAINS

SUMMARY

- Every JavaScript object has a **prototype property**, which makes inheritance possible in JavaScript;
- The prototype property of an object is where we put methods and properties that we want **other objects to inherit**;
- The Constructor's prototype property is **NOT** the prototype of the Constructor itself, it's the prototype of **ALL** instances that are created through it;
- When a certain method (or property) is called, the search starts in the object itself, and if it cannot be found, the search moves on to the object's prototype. This continues until the method is found: **prototype chain**.

NOT SO FAST...

(LET'S THINK TOGETHER)

PLANNING: STEP 1

TO-DO LIST

- Add event handler
- Get input values
- Add the new item to our data structure
- Add the new item to the UI
- Calculate budget
- Update the UI

STRUCTURING OUR CODE WITH MODULES

MODULES

- Important aspect of any robust application's architecture;
- Keep the units of code for a project both cleanly separated and organized;
- Encapsulate some data into privacy and expose other data publicly.

STRUCTURING OUR CODE WITH MODULES

UI MODULE

DATA MODULE

CONTROLLER MODULE

TO-DO LIST

- Add event handler
- Get input values
- Add the new item to our data structure
- Add the new item to the UI
- Calculate budget
- Update the UI

UNDERSTANDING ASYNCHRONOUS JAVASCRIPT: THE EVENT LOOP

SYNCHRONOUS VS. ASYNCHRONOUS

SYNCHRONOUS

```
const second = () => {
    console.log('How are you doing?');
};

const first = () => {
    console.log('Hey There!');
    second();
    console.log('The end');
};

first();
```

ASYNCHRONOUS

```
const second = () => {
    setTimeout(() => {
        console.log('Async Hey There!');
    }, 2000);
};

const first = () => {
    console.log('Hey There!');
    second();
    console.log('The end');
};

first();
```

SYNCHRONOUS VS. ASYNCHRONOUS

SYNCHRONOUS

```
const second = () => {
    console.log('How are you doing?');
};

const first = () => {
    console.log('Hey There!');
    second();
    console.log('The end');
};

first();
```

ASYNCHRONOUS

```
const image = document.getElementById('img').src;

processLargeImage(image, () => {
    console.log('Image processed!');
});
```

- Allow asynchronous functions to run in the “background”;
- We pass in callbacks that run once the function has finished its work;
- Move on immediately: Non-blocking!

LECTURE

WRAPPING UP: FINAL CONSIDERATIONS

MAKE THE PROJECT EVEN BETTER 💪

- Implement button to delete all shopping list items;
- Implement functionality to manually add items to shopping list;
- Save shopping list data in local storage;
- Improve the ingredient parsing algorithm;
- Come up with an algorithm for calculating the amount of servings;
- Improve error handling.
